

“BED BUGS”

THE FACTS:

Common signs of a bed bug infestation observing actual bugs, eggs, feces, or molted skin.

Cracks, crevices, and folds of fabric and furniture are typical hiding spots for bed bugs.

Cardboard boxes, shoe boxes, and suitcases are common “carriers” that bed bugs use to transfer from space-to-space and home-to-home.

AFTER THE INSPECTION:

You will be notified if bed bugs were observed or otherwise identified.

If the room is bed bug positive, a specialized treatment will be scheduled with the University Pest Control and the room’s residents. *Typically the next business day.*

If the room is bed bug negative, a follow-up visit will occur within seven (7) business days. At Facilities Management’s discretion, a preventive treatment may be scheduled.

IF YOU THINK YOUR ROOM HAS BED BUGS:

Submit a Work Request - there is no need to investigate on your own.

University Pest Control will complete an inspection for you after a Work Request is submitted.

Bed bugs are not known to transmit disease and are not considered an emergency. Once reported via Work Request, an inspection will be scheduled as soon as possible.
